```
"""
This script is designed to partially automate the most common SATF
request we recieve (KLOA Inc).
    At the end of this cell, you will see the following inputs:
        Analyst: a 3 letter initial name (HJR, MLS, JAR, etc)
        Date Emailed: The date the SATF email will be sent back
        Project Code: The code for the SATF --> County-Number-Year
(du-32-26)

Please note this script isn't perfect and might contain bugs, in
addition it is NOT adaptable to non KLOA requests

At this scripts current state, if everything is corectfully
formatted, the script will fill every part of the attribute table
EXCEPT the:
    TIP_Report
    Nearby_TIP
    Sponsor (WIP)
    Letter
    Category

After filling the attribute table, proceed to the next cell and run
it. The script will create a project folder IF the jurisdiction
folder exists. Keep an eye out for weird jurisdiction names such as
"Unincorporated Kane County." That might cause the folder/file
creation an issue.

    Project folder in jurisdiction folder
    county-xx-xxs powerpoint file
    county-xx-xxf word file
    county-xx-xx socioeconomic excel file

To trace the request, select the row --> Edit --> Modify Features --
> Replace Polygon --> Draw Polygon.

Create Features will NOT WORK, it will make an entirely new row.
