#####

This notebook is designed to copy the attribute table of the
ForecastRequestLayer into a designated RequestorList

Update variables at the bottom of the notebook in case of path
changes or new files

    variables:
        table --> a feature class, in this case ForecastRequestLayer
        xslv --> a .xslv file, in this case the RequestorList file
path
        field_names --> all of the field names in the
ForecastRequestLayer *Not the alias*
        wb --> the excel workbook, in this case the RequestorList
        ws --> the specific sheet in the workbook
        project_code_set --> set of unique project codes
        project_code --> single project code such as ck-67-2026,
compares against set to avoid dupes

#####

def excel(table, xslv, field_names):

    try:
        # wb is the RequestorList2026 (check variable xslv)
        wb = load_workbook(xslv)

        # change which sheet here
        ws= wb['Sheet2']

        project_code_set = set() # unique key --> project code (ex:
ck-67-26, add a new row/project code to test duplication set)
        for row in ws.iter_rows(min_row=2, values_only=True):

            project_code_set.add(str(row[0]))
            # Set full of project codes which are unique

        with arcpy.da.SearchCursor(table, field_names) as cursor:
            for row in cursor:

                project_code =

```

```
str(row[field_names.index("ProjectCode"))))

        # check if duplicate --> yes --> add row (else
ignore)
        if project_code not in project_code_set:
            ws.append(list(row))

    wb.save(xslv)
